

Accident & Emergency

Within the often pressurized environment of the casualty department (emergency room) it is essential to have timely information available to care givers without interrupting their flow of work.

The KS Medical A&E module offers an integrated management system for the department that provides full workflow support for tracking the initial Triage, registration, movements and treatments for current patients right the way through to discharge management.

Using the system allows the department to quickly identify and measure the source of patient flow bottlenecks.

With a direct link to KS Medical ADT module real-time information about bed availability and management is available. The order communications also when linked directly into the system allows for efficient interaction with other service departments within the hospital.

Full online enquiry access to the EPR allows for the immediate availability of information right to the point of care.

Our most recent innovations in this module have been:

- added large screen display of current department status (A&E Plus)
- added touch screen integration for point of care kiosk style interaction to allow for fine-grained tracking of patient flow through the department (A&E Plus)
