

System Integration (API / SDK)

As many of the locations where we deploy our systems already have existing software infrastructure investments we facilitate this process by offering an easy integration product and full connectivity services.

The integration module is tightly embedded with the core of KS Medical Suite and provides a rich set of state and event level information to interested 3rd party vendors via online, batch or on demand integration using industry standard protocols.

This module is a facilitator module that provides the technical glue that delivers a completely transparent integration effectively a "deploy and forget" integration solution.

For technical integrators we can offer a full API / SDK toolkit to access the KS Medical Suite at the same core level as all other KS Medical modules.
